

Kawasaki KZ1300 Brass Floats

March 2015

These floats are patterned on a proven design-set operating for 10 years without issues in a 1980 KZ 1300. They are drop-in replacements for the OEM Nitrophil type. Every float is leak tested throughout the assembly process and again upon completion. For your convenience each float has been pre-set to the correct "wet-level" using a KZ1300 carb.-body, bowl and **OEM float-valve**. Bench testing and customer feedback has indicated that pre-setting the tab places the wet-level of the user carbs within the correct range. The pre-set level is 7.5mm. Note: There is no "dry" measure setting for this float. Handle floats with care. Damaged floats cannot be repaired and will not be warrantied. Thank You for purchasing the KZ 1300 Brass Floats. Ride safe!

If a user adjustment is required the following procedures are recommended.

Very small adjustments will affect a fuel-level change.
